01 Test Environment

FIELD	VALUE
App name	PuniCodex: The Gods' Keyboard
Android package	`com.punicodex.app`
App version	1.3.11 (version code 25)
Device	Sharp AQUOS R8 (A301SH)
Android version	13 (SDK 33)
Screen resolution	1260 × 2730

- Tested by: Our QA team

02 App Overview

PuniCodex combines a reference guide with an Android keyboard for entering scholarly Unicode spellings of mythological names. Its companion app includes name lookup, sentence conversion, saved favorites, a 7,728-character directory, look-alike text checks, and a detailed keyboard field guide.

03 Product Perspective

The reference guide and keyboard work well together: users can look up a scholarly spelling, then enter it in another app from the keyboard's suggestion row. Direct typing, special-character insertion, favorites, directory search, and look-alike text detection all worked. Compose is too eager to convert ordinary text, while the Back behavior and several visible content and theme defects make the experience feel unfinished.

04 Test Coverage

- Passed — Saved mode: Saved “Zeús” and confirmed the favorite was still present after closing and reopening the app.
- Passed — Keyboard field guide: Reviewed the guidance for keys, suggestions, variants, the Ω directory, personalization, and symbols.
- Passed — Keyboard typing: Entered names with the PuniCodex keys, accepted “Athēnâ” from the suggestion row, switched to numbers and symbols, and inserted “Á” from the Ω directory.
- Passed — Authenticity Shield: Tried an empty submission and checked the mixed-script domain “apple.com,” which received a clear “HIGH” and “Homograph Spoof” warning.
- Passed — Help onboarding: Moved through the onboarding slides and used “Skip” to return to Type mode.
- Passed — Pantheon filters: Reviewed the scrollable Greek, Norse, Egyptian, Sanskrit, Japanese, Nahuatl, Yoruba, and Slavic choices.
- Failed — Type mode: Name cards contain an empty “FLAGSHIP LORE” panel (M-04).
- Failed — Compose mode: The ordinary word “The” is offered as a conversion to “₰” (M-02).
- Failed — Directory mode: Back closes the app instead of dismissing an open character detail sheet (M-01).
- Failed — App header: A broken-image icon is visible before the “PuniCodex” wordmark (M-03).
- Failed — Ω directory: Its light setting allows text from the app underneath to overlap the directory controls (M-05).

05 Standard Checks

- Issue — Theme: The dark Ω directory is readable, but its light setting exposes text from the app underneath and creates overlapping labels (M-05).
- Passed — Status bar: Companion pages and the keyboard stay below the status bar in portrait and landscape, and the system icons remain readable.
- Passed — Bottom safe area: The five mode tabs, keyboard rows, and Unicode directory controls stay above the system gesture area.

06 Critical / Core-Feature Issues

None.

07 Minor Issues

M-01 Back closes the app from a Directory detail sheet

Verified: ✓

Impact: A user loses their place when they expect Back to dismiss the character details and return to the directory.

Steps to Reproduce:

1. Open PuniCodex.
2. Tap “Directory.”
3. Search for “arrow.”
4. Open the left-arrow U+2190 detail sheet.
5. Press the Android Back button once.

Expected vs Actual: Back should close the character detail sheet and leave the Directory page open. Instead, one Back press closes PuniCodex and reveals the app that was behind it.

Screenshot: A still image cannot show the result of pressing Back. From a clean direct launch, one deliberate Back press while the U+2190 sheet was open stopped the PuniCodex task and returned to Chrome.

M-02 Compose replaces the ordinary word “The” with U+2101 “℀”

Verified: ✓

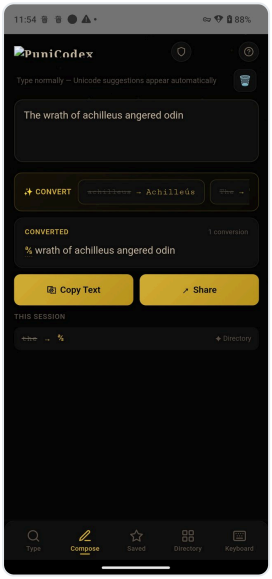

Impact: Normal prose can be corrupted when a user accepts a conversion that the app presents as valid.

Steps to Reproduce:

1. Open PuniCodex.
2. Tap “Compose.”
3. Enter “The wrath of achilleus angered odin”.
4. Find the “The → ℀” conversion chip.
5. Tap that chip.

Expected vs Actual: Compose should offer scholarly replacements for mythological names and leave ordinary English words alone. Instead, it offers “The → ℀” and visibly changes the sentence to “℀ wrath of achilleus angered odin”; the same “the → ℀” replacement is also visible in session history.

Screenshot:

M-02

M-03 The in-app wordmark uses a broken-image placeholder

Verified: ✓

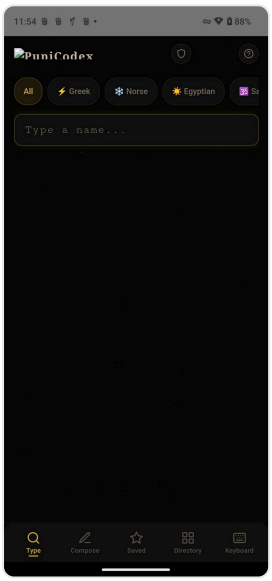

Impact: The main brand header looks unfinished on every top-level page and during onboarding.

Steps to Reproduce:

1. Open PuniCodex.
2. Look at the header beside the “PuniCodex” wordmark.
3. Open “Saved,” “Directory,” or “Help” and inspect the same header area.

Expected vs Actual: A complete PuniCodex logo should appear beside the wordmark. Instead, a broken-image icon is visibly shown immediately before the exact word “PuniCodex” across the companion app.

Screenshot:

M-03

M-04 Flagship Lore is an empty panel on major name cards

Verified: ✓

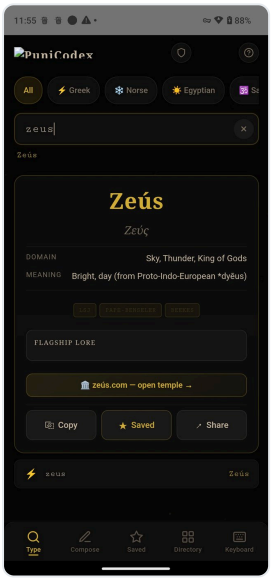

Impact: A prominently labeled section looks unfinished and provides none of the promised reference content.

Steps to Reproduce:

1. Open PuniCodex in Type mode.
2. Enter “zeus.”
3. Scroll down the result card to “FLAGSHIP LORE.”
4. Repeat the lookup with “Athena.”

Expected vs Actual: “FLAGSHIP LORE” should contain lore text, or the panel should be hidden when no text is available. Instead, the bordered panel shows only its heading and an empty body for Zeus and Athena.

Screenshot:

M-04

M-05 Light Ω directory theme lets background text overlap its controls

Verified: ✓

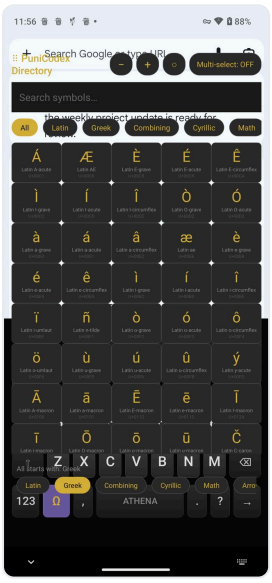

Impact: The symbol picker becomes cluttered and harder to read over light apps, making uncommon characters more difficult to choose with confidence.

Steps to Reproduce:

1. Open PuniCodex.
2. Tap “Keyboard.”
3. Open a light Chrome text field with the PuniCodex keyboard visible.
4. Tap “Ω.”
5. Tap the half-circle theme control to switch the directory to its light setting.

Expected vs Actual: The light directory should use an opaque surface that separates its title, search field, category chips, and glyph grid from the app underneath. Instead, Chrome text stays visible through the directory and overlaps the PuniCodex title, search area, category row, and lower controls while the glyph tiles and keyboard stay dark.

Screenshot:

M-05

08 Suggestions

S-01 Explain searches with no match in Type mode

When a query such as “xqzwkjv” has no result, show “No match found” with a short prompt to check the spelling or try another pantheon.

S-02 Make keyboard controls easier to understand

Move the unlabeled “−”, “+”, and theme controls from the Ω directory into a clearly labeled Keyboard preferences area, and add clear sound and haptic toggles.

S-03 Improve source-tag contrast on Type result cards

Increase the contrast of source tags such as “LSJ,” “PAPE-BENSELER,” and “BEEKES,” whose dark gold text is difficult to read against the black card.

09 Summary

We wanted to set up PuniCodex, type scholarly names in another app, browse special characters, and see how well the companion reference tools support that keyboard workflow. The main keyboard, Unicode insertion, name lookup, saved favorites, onboarding, directory search, and look-alike text warning all worked, with nothing blocking the core journey. Compose can corrupt an ordinary word, and the Back behavior plus three visible design defects should be fixed before the product reaches a wider audience.

10 About this report

This report was prepared by PrimeTestLab from testing performed on the device, build and testing window recorded in this document. Verdicts and severity ratings describe the behavior observed during that testing session.

If you have a question about any finding in this document, open the report in your PrimeTestLab dashboard and send a reply. Our team follows up on the same page.

This document was prepared for the client named on the cover. It may describe an unreleased build of your application, so please treat its contents as confidential.
